Description

Hello,

I tried to make some aliases but I discovered that case was very important. The problem is that virtual paths are case sensitive but are lowercased when we create them. For example, I tried to create a direct link to a file /MyFile toward /nv_app_MYAPP/MyFile. After creation, I have /myfile toward /nv_app_MYAPP/MyFile. Virtual path has been lowercased. The problem is that if I enter localhost:1081/MyFile in my browser, it fails. I tried with localhost:1081/myfile and it worked.

Could you explain more precisely how Aliases will work depending on case ?

Thank you
