Target version:	4.9.000	Tested:	No
Operating System:	Any		
Version:			

Description

I know how to send a mail using MAIL_SEND, is it possible to read a mail using NAP maybe by using the POP3 Protocol.

My aim is to have NAP monitor a mail account for replies from emails being sent by MAIL_SEND command and then running each reply against a procedure to update specific DB's

This may in the end lend it self to a workflow application.

If its not built into NAP at the moment, is there a plan for it or can you give your views on the best way to achieve this goal.

There is no plan to implement a pop3 client in Nirva. In any case you can easily do it by a perl (ex.: <http://search.cpan.org/~sdowd/Mail-POP3Client-2.16/POP3Client.pm>) or java procedure (ex.: <http://www.java2s.com/Code/Java/Email/JavaMailPOP3Client.htm>).

Kind regards
