**Description**

In some rare circumstances, the workflow service may produce an exception making some functions to block. This occurs on queue activities when several threads in parallel work on the same process. Another consequence is that some activity variables are suddenly re-affected to their parent activity.

**History**

**#1 - 10/14/2011 10:31 AM - Pierre Marc**

The problem has been corrected by a complete rebuild of the process locking mecanism.
